What is claimed is:

5

1. An embryonic stem cell line derived from a nucleus-transferred oocyte prepared by transferring a nucleus of a human somatic cell into an enucleated human oocyte.

- 2. The embryonic stem cell line of claim 1, which is a cell line deposited under the accession number of KCLRF-BP-00092.
- 3. A method for preparing an embryonic stem cell line, comprising the steps of:
 - (1) culturing a human somatic cell to prepare a nuclear donor cell;
 - (2) enucleating a human oocyte to prepare a recipient oocyte;
- (3) preparing a nucleus-transferred oocyte by transferring a nucleus of the nuclear donor cell into the recipient oocyte and fusing the nucleus of the nuclear donor cell and the recipient oocyte;
 - (4) subjecting the nucleus-transferred oocyte to reprogramming, activation and *in vitro* culturing to form a blastocyst; and
- (5) isolating an inner cell mass from the blastocyst and culturing the inner cell mass in an undifferentiated state to establish the embryonic stem cell line.
 - 4. The method of claim 3, wherein the embryonic stem cell line is a cell line deposited under the accession number of KCLRF-BP-00092.

5. The method of claim 3, wherein the reprogramming in step (4) is conducted for a time period of up to 20 hours.

- 6. The method of claim 3, wherein the reprogramming in step (4) is conducted for a time period of up to 6 hours.
 - 7. The method of claim 3, wherein the reprogramming in step (4) is conducted for a time period of up to 3 hours.
- 8. The method of claim 3, wherein the reprogramming in step (4) is conducted for a time period of about 2 hours.
 - 9. The method of claim 3, wherein the activation in step (4) is performed by treating the nucleus-transferred oocyte with a calcium ionophore and subsequently with 6-dimethylaminopurine.

15

20

- 10. The method of claim 9, wherein the concentration of the calcium ionophore ranges from $5\mu M$ to $15\mu M$.
- 11. The method of claim 9, wherein the concentration of the calcium ionophore is about $10\mu M$.
 - 12. The method of claim 9, wherein the concentration of 6-dimethylaminopurine ranges from 1.5mM to 2.5mM.

13. The method of claim 9, wherein the concentration of 6-dimethylaminopurine is about 2.0mM.

14. The method of claim 3, wherein the *in vitro* culturing in step (4) is performed by sequentially using at least two media, each having a different composition from the other.

5

15

20

- 15. The method of claim 14, wherein the *in vitro* culturing is performed by sequentially using two media having different compositions each other.
 - 16. The method of claim 15, wherein the *in vitro* culturing is performed by sequentially using the G1.2 medium and the SNUnt-2 medium.
 - 17. The method of claim 3, wherein step (4) is performed by reprogramming the nucleus-transferred oocyte for a time period of up to 20 hours, treating the nucleus-transferred oocyte with a calcium ionophore at a concentration ranging from 5μM to 15μM and subsequently with 6-dimethylaminopurine at a concentration ranging from 1.5mM to 2.5mM, and sequentially culturing the nucleus-transferred oocyte *in vitro* in the G1.2 medium and the SNUnt-2 medium.
 - 18. The method of claim 3, wherein the inner cell mass is isolated from the blastocyst in step (5) by a process comprising the steps of:
 - (1) removing the zona pellucida or part thereof from the blastocyst; and

(2) isolating the inner cell mass by removing the trophoblast from the resulting blastocyst.

- 19. The method of claim 3, wherein the inner cell mass is cultured in step
 (5) on a feeder layer comprising a cell differentiated from the embryonic stem cell line of claim 1.
 - 20. A neuro progenitor differentiated from an embryonic stem cell line derived from a nucleus-transferred oocyte prepared by transferring a nucleus of a human somatic cell into an enucleated human oocyte.

10

- 21. The neuro progenitor of claim 20, wherein the embryonic stem cell line is a cell line deposited under the accession number of KCLRF-BP-00092.
- 22. A method for preparing the neuro progenitor of claim 20, comprising the steps of:
 - (1) culturing the embryonic stem cell line to form an embryoid body;
 - (2) culturing the embryoid body in the presence of an agent suitable for differentiating a cell of the embryoid body into the neuro progenitor; and
- 20 (3) selecting a cell expressing a marker of the neuro progenitor and culturing the selected cell to obtain the neuro progenitor.
 - 23. The method of claim 22, wherein the embryonic stem cell line is a cell line deposited under the accession number of KCLRF-BP-00092.

24. The method of claim 22, wherein the agent employed in step (2) is selected from the group consisting of retinoic acid; ascorbic acid; nicotinamide; N-2 supplement; B-27 supplement; and a mixture of insulin, transferrin, sodium selenite and fibronectin.

25. A medium for use in carrying out the *in vitro* culturing in step (4) of claim 3, comprising:

95 to 110mM NaCl; 7.0 to 7.5mM KCl; 20 to 30mM NaHCO₃; 1.0 to 1.5mM NaH₂PO₄; 3 to 8mM sodium lactate; 1.5 to 2.0mM CaCl₂ · 2H₂O; 0.3 to 0.8mM MgCl₂ · 6H₂O; 0.2 to 0.4mM sodium pyruvate; 1.2 to 1.7mM fructose; 6 to 10mg/ml human serum albumin; 0.7 to $0.8\mu g/ml$ kanamycin; 1.5 to 3% essential amino acids; 0.5 to 1.5% nonessential amino acids; 0.7 to 1.2mM L-glutamine; and 0.3 to 0.7% a mixture of insulin, transferrin and sodium selenite.

15

20

10

5

26. The medium of claim 25, which comprises:

99.1 to 106mM NaCl; 7.2mM KCl; 25mM NaHCO₃; 1.2mM NaH₂PO₄; 5mM sodium lactate; 1.7mM CaCl₂ · 2H₂O; 0.5mM MgCl₂ · 6H₂O; 0.3mM sodium pyruvate; 1.5mM fructose; 8mg/ml human serum albumin; $0.75\mu g/ml$ kanamycin; 2% essential amino acids; 1% nonessential amino acids; 1mM L-glutamine; and 0.5% a mixture of insulin, transferrin and sodium selenite.
